About Me

I’m a **Mobile Developer** with a background in **Backend Software Development** and hands on experience building and maintaining **real world business applications**. I worked on systems such as **WMS**, **B2B** and **B2C** applications. In my current role, I have worked on the development and modernization of **warehouse management solutions**, including taking **ownership** of a **new Dynamic WMS project** and helping rebuild an existing application with a stronger focus on **UI/UX**, **performance** and **maintainability**. My work has included modernizing **Android** applications from **Material 2** to **Material 3**, working across different **Android SDK versions**, improving **API communication** and **optimizing large datasets** using **lazy loading** and **scroll triggered data enrichment**. I have also worked with **Retrofit**, **Hilt**, **Dagger**, **Firebase**, **Crashlytics** and integrations with Wi Fi and Bluetooth printers using formats such as **ZPL**, **ESC/POS** and raw **PDF** printing. Alongside my professional work, I develop personal projects such as **E-Efimerevon**, a **multi component** pharmacy platform built with **Android**, **Java 21**, **JavaFX**, **Ktor**, **Firebase** and **computer vision**. I enjoy working across the full application lifecycle, solving practical problems and continuously improving the systems I work on.
